- 4 Conclusion

Participants and time frame

- Dragan Ivanovic, University of Novi Sad, Serbia
- Host: Hanna-Mari Puuska, CSC – IT Center for Science Ltd, Espoo
- Also involved Joonas Nikkanen, Lauri Hellsten and Olli Eskola
- First two weeks of September 2018

Aim and activities

- Aim: to investigate the potential use of international metadata standards, CERIF in particular in harvesting and exporting publication data in the frame of the VIRTA system
- Activities:
 - Matching of VIRTA data model entities' properties to CERIF entities' properties
 - Implementation of OpenAIRE guidelines for CRIS managers

Result

- T-SQL procedure for mappings CERIF data to VIRTA data model
- Extension of VIRTA OAI-PMH server side implementation in accordance with OpenAIRE guidelines

Outline

- 1 Introduction
 - STSM
 - **VIRTA**
 - OpenAIRE
- 2 Methodology
- 3 Implementation
- 4 Conclusion

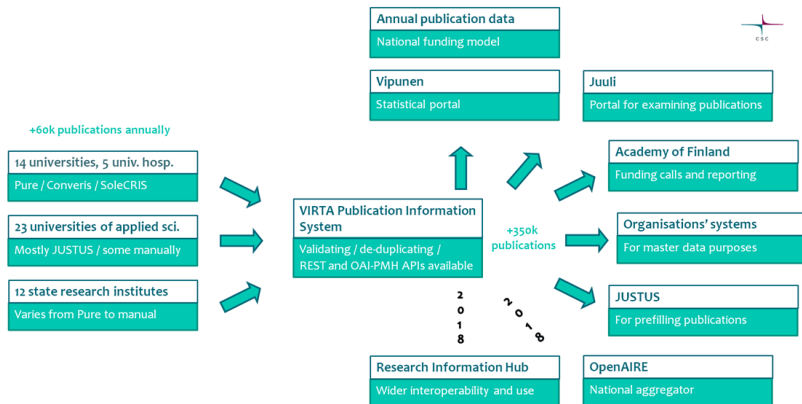

Collection

- Collects bibliographic information on scientific publications from 54 Finnish research organizations
- About 60,000 publications per year are harvested, and all scientific fields are covered
- Publication metadata is based on a national data model

Usage

- For the Finnish universities, 13% of core funding (200 mill. euros) is allocated via publication points calculated based on publication types and their level
- The bibliographic data are published at JUULI (www.juuli.fi) and statistics at Vipunen (www.vipunen.fi/en-gb/)
- The queries are available in a machine readable format via authenticated REST API (XML, JSON) and OAI-PMH API (Dublin Core, XML)

VIRTA interfaces

ENRESSH-VIRTA vs VIRTA

- Same software architecture
- Same data model
- SSH Publications' metadata collected from repositories all over the Europe vs publications' metadata collected from Finnish repositories

Outline

- 1 Introduction
 - STSM
 - VIRTA
 - **OpenAIRE**
- 2 Methodology
- 3 Implementation
- 4 Conclusion

Mission

- The mission of the H2020 project OpenAIRE is to shift scholarly communication towards openness and transparency and facilitate innovative ways to communicate and monitor research
- OpenAIRE project is a platform (<https://www.openaire.eu/>) representing a hub of scientific results collected from research infrastructure nodes across the Europe

OpenAIRE and Finnish publications

- By 2018, the OpenAIRE platform harvests Finnish publications' metadata from 9 repositories
- 5 universities' repositories as well as most of the research institutions in Finland are missing in OpenAIRE
- This is due to cumbersome implementation needed on repository-level to be compliant with OpenAIRE specifications
- In addition, repositories rarely include any metadata on scientific publications that are not self-archived
- For these reasons a major share of Finnish publications' metadata is not transferred to OpenAIRE.

OpenAIRE Guidelines for CRIS managers

- Version 1.1 was released in June 2018
- The Guidelines provide orientation for CRIS managers to expose their metadata in a way that is compatible with the OpenAIRE infrastructure
- Protocol for collecting data according to this guidelines is the OAI-PMH protocol, while the format for collecting data is a CERIF profile

OpenAIRE Guidelines for CRIS managers - implementations

- METIS2OpenAIRE is an OpenAIRE-funded project led by euroCRIS
- Omega-PSIR, PURE, VIRTA, NARCIS, and CRIS UNS also working on the implementation
- DSpace-CRIS planning to implement

Outline

- 1 Introduction
 - STSM
 - VIRTA
 - OpenAIRE
- 2 Methodology
- 3 Implementation
- 4 Conclusion

Mapping VIRTA data model to OpenAIRE (CERIF) data model

- There are many similarities between VIRTA and CERIF data models
- However, there are some key differences which should be addressed to properly implement the mapping
 - different classification of publication types,
 - presentation of IDs,
 - open access classifications and
 - Finnish national classifications of scientific fields

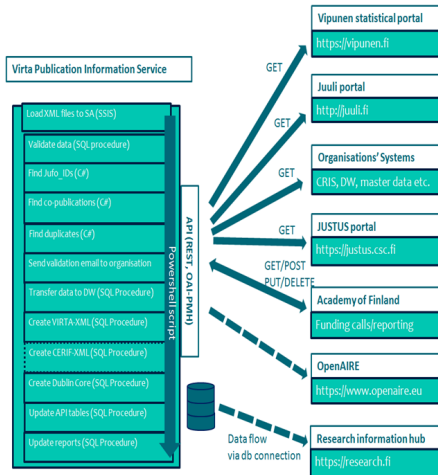

Making procedure for converting data from VIRTAs to CERIF-XML

- The new T-SQL procedures which implements mappings from the previous point should be implemented
- Those procedures should be run each night to update CERIF-XML data table

Extension of the VIRT A OAI-PMH endpoint in accordance with the Guidelines

- OAI-PMH was already implemented in VIRT A for providing metadata in both Dublin Core and VIRT A-XML formats
- This implementation is used as basis for implementing OpenAIRE specifications
- However, this implementation should be extended with support for
 - new metadata prefix - oai_cerif_openaire,
 - the OpenAIRE supported sets: openaire_cris_publications, openaire_cris_persons, openaire_cris_events, openaire_cris_orgUnits
 - the new format - CERIF XML

VIRTA OAI-PMH

Making agreement with organizations on what information they want to be made available for harvesting

- VIRTA only stores a copy of publication metadata and research organizations act as owners of the metadata
- As such, permissions are needed for metadata to be allowed to external services / use
- Organizations need to decide if
 - OpenAIRE can harvest their data
 - Which publication years should be included in the harvest
 - The other limitations for the harvest (e.g. publication types)

Outline

- 1 Introduction
 - STSM
 - VIRTA
 - OpenAIRE
- 2 Methodology
- 3 Implementation**
- 4 Conclusion

Mapping VIRTA data model to CERIF data model

- Mapping has been defined - <https://wiki.eduuni.fi/pages/viewpage.action?pageId=80941717>
- Classification of publications types prescribed by Ministry of Education and Culture, Finland are mapped to classification prescribed by OpenAIRE
- Local identifiers and generated identifiers based on ISSN, ISBN, ORCID, etc.
- Finnish Thesaurus and Ontology Service has been used for definition of vocabulary of Finnish national scientific fields

Making procedure for converting data from VIRTATA to CERIF-XML

Script name	Number of lines	Purpose of script
<u>JulkaisutCERIF_Luonti</u>	970	Transfer publications from VIRTATA to CERIF-XML publication entity
<u>JulkaisutCERIF_ISSN_Luonti</u>	870	Transfer parent publications with ISSN ID from VIRTATA to CERIF-XML publication entity
<u>JulkaisutCERIF_ISBN_Luonti</u>	960	Transfer parent publications with ISBN ID from VIRTATA to CERIF-XML publication entity
<u>OrganisaatiotCERIF_Luonti</u>	610	Transfer organisations from VIRTATA to CERIF-XML organisation entity
<u>TapahtumatCERIF_Luonti</u>	260	Transfer events from VIRTATA to CERIF-XML event entity
<u>TekijatCERIF_Luonti</u>	460	Transfer persons from VIRTATA to CERIF-XML person entity

Extension of the VIRTA OAI-PMH endpoint in accordance with the Guidelines

- The OAI-PMH endpoint has been extended
- The testing and validation has been performed using OpenAIRE CRIS-validator -
<https://github.com/jdvorak001/openaire-cris-validator>
- Test endpoint is available at
<https://dwitjutife1.csc.fi/api/cerif>

Making agreement with organizations on what information they want to be made available for harvesting

- Written permissions from organizations on data harvest are being collected
- The T-SQL script will convert data to CERIF-XML as agreements come and thus make available publications via OAI-PMH endpoint

Outline

- 1 Introduction
 - STSM
 - VIRTA
 - OpenAIRE
- 2 Methodology
- 3 Implementation
- 4 Conclusion

Summary

- The vision of OpenAIRE project is to allow citizens, educators, funders, civil servants and industry find ways to make science useful for themselves, their working environments, and the society
- The presented implementation of OpenAIRE Guidelines for CRIS managers can be adjusted for the needs of exporting data from CRIS systems all over the Europe to OpenAIRE platform

Summary

- The vision of OpenAIRE project is to allow citizens, educators, funders, civil servants and industry find ways to make science useful for themselves, their working environments, and the society
- The presented implementation of OpenAIRE Guidelines for CRIS managers can be adjusted for the needs of exporting data from CRIS systems all over the Europe to OpenAIRE platform

Future work

- We are in contact with OpenAIRE software developers and working on integration of VIRTAs and OpenAIRE
- OpenAIRE Guidelines for CRIS managers will be slightly modified (version 1.1.1)
- A conference paper describing results of the STSM accepted for presentation (ICIST 2019), the full paper should be written and published in proceedings
- STSM in Novi Sad

Application of similar approach to ENRESSH-VIRTA

- ENRESSH-VIRTA is instance of VIRTA system with different data
- Implementation of VIRTA mapping and extension of VIRTA OAI-PMH server side can be adopted
- Possible issues
 - publication types - should be mapped to OpenAIRE publication types
 - scientific fields - machine readable vocabulary should be created (rdf)
- The European centralized solutions (ENRESSH-VIRTA) can provide information on research in a consistent format so that each organization does not need to build its own reporting solution to external systems (OpenAIRE)

Questions

- Thank you for your attention!!!
- If you have any questions, please do not hesitate to
 - ask me now
 - ask me during the conference breaks
 - contact me via email address dragan.ivanovic@uns.ac.rs
